Your guide to our super-fast, super-secure UK platforms

Platforms & Specs

Your guide to our super-fast, super-secure UK platforms

Shared hosting with a difference

Unlike with other web hosts, your website isn't tied to one single server but makes use of a whole platform, meaning that you get incredible reliability and speed at an unbelievably low price. Traditional shared hosting performance is subject to how much traffic you get and what other users are doing, but our platforms are load-balanced and automatically scale to meet resource demands at no extra cost to you. Your website stays online and runs fast so you can concentrate on your business.

Key features:

- Choose from three powerful platforms: Linux, WordPress, or Windows
- Autoscaling and load-balanced
- Enhanced speed and security
- 100% SSD (solid state drive) storage
- IPv6 enabled
- Secure, state-of-the-art UK data centre
- Friendly UK support

Data centre and hardware

Our intelligent and advanced UK data centre is kitted out with premium hardware and the latest and greatest security and environmental technologies. With technicians onsite 24/7 every day of the year and a resilient national network for ultimate reliability, you can rest assured that your websites are safe with us.

We've invested heavily in our hardware to ensure optimal performance and a faultless design with no single point of failure. Each server has Dual Intel Xeon CPU E5-2640 v3 octa-core processors with hyper-threading for 32 logical cores and 64GB DDR4 RAM. All MySQL and MSSQL databases are hosted on dedicated 32 core servers with 128GB RAM and full SSD storage.

We've developed an incredibly resilient high performance storage platform utilising 100% SSD storage arrays in a RAID 10 configuration, with battery-backed hardware RAID cards. Storage arrays are then replicated across multiple servers so in the highly unlikely event that disks, arrays or entire servers fail there will be no downtime or impact to your site. We take daily data backups, which are stored at a secured offsite facility. We also run our own bespoke Web Application Firewall that continually monitors and filters out threatening requests before they can even target your website.

single point of failure and your website performance will never be affected by other users' websites, visitors or activity. All servers have SSD storage as standard, and we've optimised every part of your experience for maximum speed and security. Our hosting is designed to scale as your website grows, meaning the same great performance no matter how popular you get.

We have a range of web hosting packages available to suit most web space, bandwidth and database requirements. However, if you need a custom solution, we're more than happy to create a unique plan that works for you.
